Professional Email Security at a price you can afford

BakerWatchTM Mail Monitor is a pre-emptive email security service that shields customers from online attacks before they impact business assets. **BakerWatchTM Mail Monitor** filters out spam, viruses, offensive content, and fraudulent email before it even reaches your network, freeing up a huge amount of bandwidth on your internet connection. For most business owners, the prohibitive cost of internally deploying industrial grade email security solutions forces them to settle for inferior products that fail to deliver. **BakerWatchTM Mail Monitor** leverages a network of secure data centres to make best-of-breed email security affordable. Whether your business has 5 users or 50,000 users, we provide you with the best protection available. What's more, we provide it on a pay-monthly basis, with no capital expenditure.

Maintain system uptime by protecting you from virus infection

Unprotected businesses run the risk of system downtime, loss of important data, or unlawful random distribution of confidential files. Email is now the fastest and most effective method for transmitting viruses. Cyber crime is on the increase and those responsible for introducing new strains of email virus continue to find more creative ways to disguise their harmful payload. The only way to protect your business from email borne virus threats is to adopt a multi-layered approach. **BakerWatchTM Mail Monitor** takes pre-emptive steps to catch all email viruses at Internet level. We understand the need to enforce border protection for your business, at the very perimeter of your network, before a virus can ever get a chance to inflict damage to your server. Our **BakerWatchTM Mail Monitor** Outbreak Protection Engine stops viruses from the moment they are released. **BakerWatchTM Mail Monitor** protects your business against 100% of all known viruses.

Protect your network and staff from unwanted email

Businesses have increasingly become reliant on email for commercial purposes. This reliance is threatened by hostile spam, which now represents over 80% of email sent across the Internet. In practical terms that means your employees are processing up to 5 times more email than they need to just to find genuine business email. **BakerWatchTM Mail Monitor** Spam Filtering is a fully managed service that takes pre-emptive measures to stop spam from reaching your users, or your network.

Real-time protection from new financial threats

The increasing popularity of online financial services such as Internet Banking, online payment services and online shopping, presents growing opportunities for cyber crime. People are becoming more and more accustomed to accessing their bank accounts and giving out their credit card details over the Internet. Unfortunately with these advancing technologies, come new threats. Online fraud / phishing scams are on the increase, with the average email fraud netting over €1200. User vigilance is not enough to prevent these scams. **BakerWatch™ Mail Monitor** Secure Automated Fraud Protection is powered by world-leading phishing engines, backed by a 24-hour active response team to new threats, giving you piece of mind that your email will remain free from the threat of fraudulent attack.

BakerWatch™ Mail Monitor *Plus*

End-To-End Mail Server Protection with 24 X 7 Monitoring

Email is the life-blood of your business and is vital that it is working at all times. **BakerWatch™ Mail Monitor *Plus*** combines all the security features in the Mail Monitor service while proactively monitoring your email server and subcomponents to ensure that you can always send and receive mail.

Mail Monitor *Plus* watches system services such as POP3, IMAP & SMTP to ensure that they are correctly processing mail. It also ensures availability by checking the CPU performance, disk space on the hard drive and if the server is online. Mail Monitor *Plus* sends automated alerts via alternate mail servers, SMS and voice and can take corrective action (including restarting the service) if they are not running. With **BakerWatch™ Mail Monitor *Plus*** problems can be resolved before impacting users.

With **BakerWatch™ Mail Monitor *Plus*** users get access to a Web portal where they get an overall picture of their email server's current state at a single glance. The Web portal reflects the current status of the email server highlighting the operation of critical services and hardware components and identifying potential trouble-spots so you can take action before the server fails.

BakerWatch™ Mail Monitor eliminates spam, viruses, fraud and protects your Server Network
